

Is Your Website Hackable?

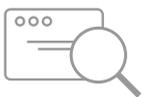

70% are. Detect and action with Acunetix

As many as 70% of websites contain vulnerabilities that can lead to the theft of sensitive corporate data such as credit card information and customer lists. Website security must be a priority in any organization but remains overlooked. Hackers concentrate on web-based applications such as shopping carts, forms, login pages and dynamic content. Web applications are accessible 24/7 and control valuable data since they often have direct access to back-end data.

Firewalls, SSL and Hardened Networks are Futile against Web Application Hacking

Any defense at network security level will provide no protection against web application attacks since they are launched on ports 80/443 – which have to remain open. In addition, web applications are often tailor-made therefore tested less than off-the-shelf software and are more likely to have undiscovered vulnerabilities.

Acunetix automatically tests websites and web applications for SQL Injection, XSS, XXE, SSRF, Host Header Attacks & over 4500 other web application vulnerabilities. In addition, Acunetix provides tools for ensuring vulnerabilities are not only discovered, but remediated in context of business-criticality; as well as providing management with reports required to make strategic decisions.

Crawl & Scan

What you can't crawl you can't scan. Acunetix can crawl complex web application architectures including JavaScript-heavy HTML5 Single Page Applications while being able to scan restricted areas automatically & easily.

Detect & Alert

With vulnerability detection, it's accuracy that counts. Acunetix detects over 4500 types of web app vulnerabilities alerting according to severity. It's ability to scan accurately, guaranteeing low false positives, is what places it above the rest.

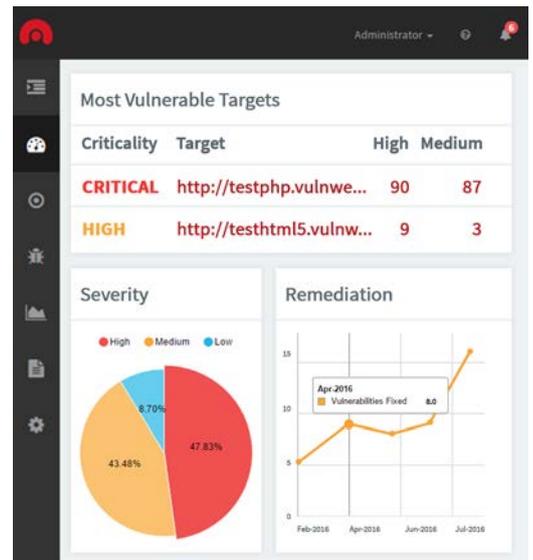

Prioritize & Manage

Aggregate and review vulnerability data across your organization with built in Vulnerability Management. Prioritize security risks based on business criticality and conform to several regulatory and compliance standards.

Acunetix - The Technology Leader in Web Application Security

Acunetix are the pioneers in Automated Web Application Security Testing with an engineering lead in website structure analysis and vulnerability detection. The Acunetix innovative technologies include:

- **DeepScan** Technology allows accurate crawling of AJAX-heavy client-side Single Page Applications (SPAs) that leverage complex technologies.
- Industry's most advanced and robust SQL Injection and Cross-site Scripting testing, including advanced detection of DOM-based XSS.
- A **Login Sequence Recorder** that allows the automatic crawling and scanning of complex password protected areas.
- **AcuSensor Technology** allows accurate scanning reducing false positives, by combining black-box scanning techniques with feedback from its sensors placed inside the source code.
- Built-in tools to discover, measure and remediate vulnerabilities with ease. Including a wide variety of management and compliance reports.
- Acunetix Multi-Engine - suitable for Enterprise customers who need to scan many web applications simultaneously. Deploy multiple scanning engines all managed from a central console.
- Highest detection of WordPress, Joomla! and Drupal vulnerabilities.

Severity	Vulnerability
CRITICAL	Blind SQL Injection
CRITICAL	Cross-site Scripting
CRITICAL	DOM-based Cross-site Scripting
CRITICAL	Nginx SPDY Heap Buffer Overflow
HIGH	Directory Listing
HIGH	Source Code Disclosure

In-depth Testing for SQL Injection and XSS

Acunetix rigorously tests for thousands of web application vulnerabilities including SQL Injection (SQLi) and Cross-site Scripting (XSS). SQLi is one of the oldest and most prevalent of software bugs; it allows attackers to modify SQL queries in order to gain access to data in the database. XSS attacks allow attackers to execute malicious scripts inside a visitors' browser; possibly leading to impersonation of that user. Acunetix is the industry leader in detecting the largest variety of SQLi and XSS vulnerabilities, including Out-of-band SQL Injection and DOM-based XSS.

AcuSensor Guarantees Low False Positives

Traditional web application security testing (black-box testing) will not see how code behaves during execution and source code analysis will not always understand what happens when code is in execution. Acunetix AcuSensor combines these two methodologies and is able to achieve a significantly higher detection of vulnerabilities.

Acunetix AcuSensor Technology deploys an agent inside the source code to provide Interactive Application Security Testing (IAST) functionality. It then relays feedback to the scanner during the source code's execution, indicating the line of code where the vulnerability lies and reporting additional debug information. This greatly increases remediation efficiency.

SQL Injection High Open

Attack details

URL encoded GET input **cat** was set to **1A0**

Source file

/hj/var/www/listproducts.php line: **61**

SQL query

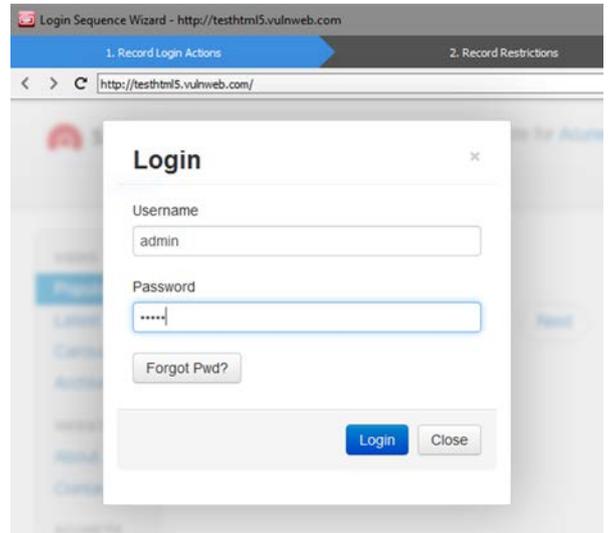

```
SELECT a.*, b.aname, b.artist_id,
teg c WHERE a.cat_id=c.cat_id AND
```

Hassle-free Authenticated Web Application Testing

Testing authenticated areas of your websites is absolutely crucial to ensure full testing coverage. Acunetix can automatically test authenticated areas by recording a Login Sequence using the Login Sequence Recorder (LSR). The LSR makes it quick and easy to record a series of actions the scanner can re-play to authenticate to a page.

The Acunetix Login Sequence Recorder supports a large number of authentication mechanisms including:

- ✓ Multi-step/Custom Authentication Schemes
- ✓ Single Sign-On Authentication
- ✓ CAPTCHAs
- ✓ Multi-factor Authentication

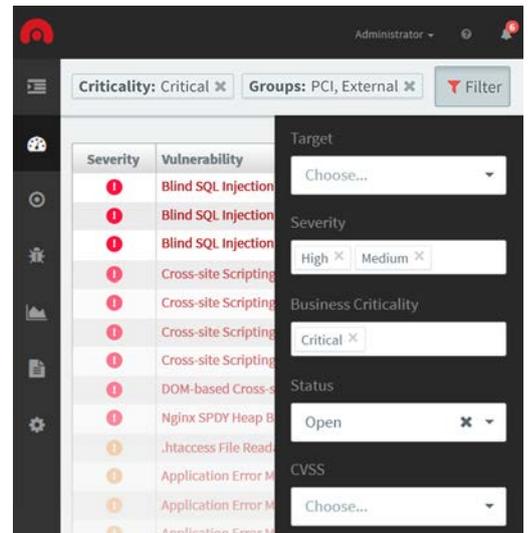

Accurately Crawl and Scan with DeepScan

Acunetix features DeepScan Technology which allows the scanner to robustly test any application, no matter what web technology it's written in. At the heart of DeepScan, is a fully automated web browser that can understand and interact with complex web technologies such as AJAX, SOAP/WSDL, SOAP/WCF, REST/WADL, XML, JSON, Google Web Toolkit (GWT) and CRUD operations just like a regular browser would. Acunetix can test web applications just as though it is running inside of a user's browser, allowing the scanner to seamlessly interact with complex controls as a user would, significantly increasing the scanner's coverage of the web application.

Vulnerability Management

The Acunetix multi-user, multi-role features allow team members to be flexible and productive while getting access only to resources they need. Vulnerability Management features allow the team to easily maintain an integrated view of the security posture throughout the application portfolio by storing everything into a single, central location.

- ✓ Easy-to-use web interface
- ✓ Role-based multi-user system
- ✓ Prioritize risks based on vulnerability data and importance of application
- ✓ Group assets for easier management
- ✓ Export vulnerabilities to Atlassian JIRA, GitHub and Microsoft TFS
- ✓ Integrates with Jenkins for Continuous Integration
- ✓ Generate advanced management and compliance reports (such as PCI DSS, OWASP Top 10, ISO 27001, HIPAA and others)

Advanced Network Level Scanning

Acunetix integrates the popular OpenVAS scanner to provide a detailed inspection of public facing network assets, integrated seamlessly with the testing of web applications.

Acunetix will test for: Weak passwords, insecure web server configuration, directories with weak permissions, DNS server vulnerabilities, FTP access tests, badly configured Proxy Servers, weak SSL ciphers, and many other sophisticated security checks, all from an easy-to-use cloud-based service.

WordPress, Joomla! and Drupal Vulnerability Scanning

Acunetix identifies WordPress installations, and launches over 4000 vulnerability checks in the WordPress plugins, core and themes. In addition, Acunetix can also detect vulnerabilities in Joomla! and Drupal Content Management Systems (CMSs) that have their own share of vulnerabilities and misconfigurations.

Automatic Web Application Firewall (WAF) Configuration

Acunetix supports Imperva SecureSphere, F5 BIG-IP Application Security Manager and FortiWeb WAF. It can automatically create the appropriate WAF rules to protect web applications against attacks targeting vulnerabilities the scanner finds. This allows you to temporarily prevent exploitation of high-severity vulnerabilities until you are able to fix them.

Available on Windows, Linux and Online

Acunetix is available Online or On Premise on both Windows and Linux. Both versions are licensed per year for any number of scan targets. The On Premise version is available as an entry level **Standard Edition** and a **Premium Edition** that adds multi-user, collaborative team capability and can control multiple Acunetix scan engines. All Editions allow users to automatically and accurately scan and perform extensive penetration tests on an unlimited number of websites, while properly managing remediation in a consolidated manner on an ongoing basis.

About Acunetix

Founded in 2004 to combat the alarming rise in web application attacks, Acunetix is the market leader, and a pioneer in automated web application security technology. Acunetix is depended on globally by individual pen-testers and consultants, all the way to large organizations such as the Pentagon, Nike, Disney, Adobe and many more. For more information, visit www.acunetix.com/company.

Customer Testimonials

"Acunetix v12 is crazy fast and the concurrent scans went way up! I could only do 10 concurrent scans before, but now I am running over double the amount concurrently. This is a huge increase in performance and capacity saving greatly on our monthly costs.."

Bill F.
Web App Service Lead, VITA

"We use Acunetix for initial site enumeration and to ensure that we cover all common surface area and attacks with at least a minimum level of testing. Most of our testing is completed manually and we find logic issues etc. but occasionally focus on difficult to find issues instead of simple issues, like a file upload flaw hidden in the corner of a site that Acunetix brings to our attention."

Brian W. Gray
Sr. Information Security Engineer
Carnegie Mellon University

"We use Acunetix as part of our Security in the SDLC and to test code in DEV and SIT before being promoted to Production."

Kurt Zanzi
Information Security Office
Xerox CA-MMIS
